## IN THE CLAIMS

Please amend the claims as follows:

- 1. (original) A system for use in an electric or optical device comprising at least two organic or metallo-organic energy and/or charge variable moieties having conjugated unsaturated bonds, wherein at least one moiety has an energy state different from another of said moieties, characterized in that the system is a H-donor-H-acceptor system comprising at least one H-donor molecule having at least two hydrogen bonding clusters, each cluster comprising at least two groups having formed a hydrogen bond, and at least two H-acceptor molecules, each having at least one hydrogen bonding cluster, each cluster comprising at least two groups having formed a hydrogen bond with the groups of the H-donor molecule, at least one of the H-donor and H-acceptor molecules further comprising one or more of the organic or metallo-organic energy and/or charge variable moieties.
- 2.(original) The system of claim 1 wherein the hydrogen bond is an N-H-N, O-H-O, or N-H-O bond.
- 3.(currently amended) The system of claim 1 or 2-comprising at least 2 of the H-donor molecules and at least 3, preferably at least 4, of the H-acceptor molecules.
- 4. (currently amended) The system of any one of claims 1—3 wherein the organic or metallo-organic energy and/or charge variable moieties are semi-conductors.

- 5. (currently amended) The system of any one of claims 1-4 wherein the organic or metallo-organic energy and/or charge variable moieties having the lowest energy state is a luminescence dye.
- 6.(currently amended) The system of any one of claims 1-5 wherein the H-donor and H-acceptor molecules are soluble in a solvent.
- A system for use in an electric or optical device 7.(original) comprising at least two organic or metallo-organic energy and/or charge variable moieties having conjugated unsaturated bonds, wherein at least one moiety has an energy state different from another of said moieties, characterized in that the system is a Hdonor-H-acceptor system comprising at least one H-donor molecule having at least two hydrogen bonding clusters, each cluster comprising at least two groups having formed a hydrogen bond, and at least two H-acceptor molecules, each having at least one hydrogen bonding cluster, each cluster comprising at least two groups having formed a hydrogen bond with the groups of the H-donor molecule, at least one of the H-donor and H-acceptor molecules further comprising at least an organic or metallo-organic energy and/or charge variable moiety having conjugated unsaturated bonds, wherein at least one of the H-acceptor and H-donor has formed a complex or is bonded to a backbone having a plurality of hydrogen bonding clusters.
- 8.(original) The system of claim 7 wherein the organic or metallo-organic energy and/or charge variable moieties are semiconductors.

- 9.(currently amended) An electronic device having at least two electrodes with at least one layer of the system of  $\frac{1-8}{2}$  dispersed therein between.
- 10.(original) The electronic device of claim 9 wherein the device is an electroluminescent device, field-effect transistor, sensor or photovoltaic device.
